

Goal Setting and Acceptance Criteria

Ideally, by the conclusion of the internship, our team will have completed our project in conjunction with THRIVE clients. The central meaning behind our work involves the creation of a broadband asset inventory in the tri-state region, which we can use to generate a full-scale geo-spatial web application. Preferably, both our inventory and geo-spatial map should highlight all 16 specific counties, present physical infrastructures, literacy/access, potential partners, and all necessary sub constituents as indicated below.

However, we are aware that we may not execute our plan as we envision, especially due to time constraints. With that in mind, our team has come up with an acceptance criteria. If we are not able to create a full-scale geo-spatial web application and a database with a full broadband asset inventory, we are aiming to have at least a prototype geo-spatial web application that displays one asset, as well as a spreadsheet containing data of one broadband asset. Both of these, in addition to our notes and presentations along the way, will have open source availability in our github wiki page. If we can achieve this bare minimum, that would still be a success to our team.
